# Clinical Co-Pilot (CIOS) — Complete Product Walkthrough

**Clinical Co-Pilot** is more than just a medical scribe; it is a **Clinical Intelligence Operating System (CIOS)**. It bridges the gap between patient conversations and actionable medical records, financial automation, and clinical outcome tracking.

---

## 🚀 Executive Summary: The CIOS Vision

The **Clinical Intelligence Operating System (CIOS)** creates a "Flywheel Effect" in healthcare documentation:

1. **Ambient Capture**: Discrete background listening during patient encounters.
2. **Intelligent Reasoning**: LLM-driven synthesis of unstructured dialogue into structured notes.
3. **Closing the Loop**: Linking clinical sessions to financial superbills and longitudinal outcome assessments (PHQ-9/GAD-7).

---

## ✨ Core Features

### 1. Ambient Listening & Real-Time Transcription

- **Engine**: Deepgram `nova-2-medical`.
- **Diarization**: Real-time identification of Speaker 0 (Doctor) and Speaker 1 (Patient).
- **Latency**: Sub-second streaming to the UI.

### 2. Intelligent Note Generation (Multi-Format)

Supports three industry-standard clinical formats:

- **SOAP**: Subjective, Objective, Assessment, Plan.
- **DAP**: Data, Assessment, Plan (Behavioral Health focus).
- **GIRP**: Goals, Interventions, Response, Plan (Process-oriented).

### 3. Invisible Billing (Superbill Generator)

- **Automatic Mapping**: Extracts clinical entities to suggest **ICD-10** diagnosis codes.
- **CPT Optimization**: Suggests billing codes (e.g., 90834, 90837) based on session duration and complexity.
- **Lifecycle Management**: Tracks bills from "Draft" through "Ready for Payer" to "Paid".

### 4. Outcome Intelligence

- **Longitudinal Tracking**: Integrated **PHQ-9** (Depression) and **GAD-7** (Anxiety) scoring.
- **Flywheel Effect**: Assessment scores inform the AI's "Assessment" and "Plan" sections of the clinical note.

### 5. Appointment Inbox

- **Lifecycle**: Pending → Scheduled → Completed.
- **Dashboard Integration**: Real-time notification badge for new patient requests.

---

## 🏗️ Architecture & Data Flow

### The Hybrid Stack

```
flowchart TD
    A[Patient-Doctor Audio] --> B(Deepgram API)
    B --> C{Live Transcript}
    C --> D[Orchestration Layer]
    D --> E[OpenAI GPT-4o]
    E --> F[Structured Clinical Output]
    F --> G[(Supabase PostgreSQL)]
    G --> H[Doctor Dashboard]
    G --> I[Patient Portal]
    F --> J[Superbill Generator]
```

### Key Components

- **Orchestration**: Next.js Server Actions handle multi-step flows (Generate → Refine → Save).
- **Security**: Supabase Row Level Security (RLS) ensures data is only accessible to the authorized clinician/patient.
- **Risk Alert Engine**: GPT-4o powered analysis of clinical risk (Suicidal Ideation, Self-Harm, Substance Use).

---

## 🎛️ UI & UX Design

### Doctor Dashboard

- **Patient Roster**: Sortable by priority and recent activity.
- **Active Session**: High-contrast recording controls with real-time waveform and transcript bubbles.
- **Intelligence Side-Panel**: Slide-in panel for AI notes, entity cards (Medications, Symptoms), and the Superbill generator.

### Patient Portal

- **Dashboard**: Simple overview of upcoming appointments and health progress.
- **Self-Service**: Ability to register for roles and request appointments.

---

## 🛠️ Implementation Details

### Server Actions ( `src/app/actions.ts` )

- `generateClinicalNote` : Toggles between SOAP, DAP, and GIRP prompts.
- `saveSuperbill` : Persists financial data linked to sessions.
- `getDashboardStats` : Aggregates cross-table data (Patients, Appointments, Billing).

### Intelligence UI ( `src/components/NoteGenerator.tsx` )

- **Interactive Drafting**: Clinicians can toggle "Edit Mode" to refine AI suggestions before saving.
- **Entity Chips**: Color-coded badges for quick visual scanning of Clinical Entities.

---

## ✅ Validation & Working Procedures

### Clinical Validation

1. **Transcription Accuracy**: Benchmarked using `nova-2-medical` for high terminology precision.
2. **Role Identity**: Verification of "Who said what" before note generation.
3. **Risk Scoring**: Automated severity ranking (1-10) to flag high-priority cases.

## Future Roadmap

- **Closing the Loop 2.0**: Automated follow-up task generation.
- **EHR Integration**: Seamless push to EPIC/Cerner via FHIR.
- **Voice-to-Task**: "Hey Clinical Co-Pilot, schedule a follow-up for next Tuesday."
